FEATURES

X-
PROCESSOR
5

Film Simulation

A provision of modern convenience with the ability to transform images into film as the new 'analog'.

The flexibility of creative control, once a RAW image is taken, you can always adjust the film recipe to your liking

On-sensor phase detection

Special autofocus pixels are built directly into the digital image sensor to measure light phase differences and achieve fast, accurate focusing

X-Processor 5

Uses deep learning to track humans, animals, birds, cars, bikes, insects, and drones automatically.

Spectral Sensitivity Curve

Film rendering of color is enormously complex process virtually impossible to mimic

PHOTO PIXEL DIVISION

Photo Divided by shadows, midtones, highlights, vibrance,

(subject isn't excluded, its

PATTERN BUILDING

Mapping each dimension to pattern:

- shadows =
- highlights =
- temperature = based on
- warm hues shift toward orange/red
- midtones = criss-cross
- dominant colors: folded colors so it mirrors the photo

- Vibrancy → measure the photo's average saturation → apply that same saturation level to the shape colors in the output
- shape size = dependent on how much of that element occupies the space in the image
- 1-100 score: relevant for shadows, highlights, midtones basically if there are more shadows, highlights, midtones dominant in the photo they are individually scored + ranked

DEVELOPING THE SYSTEM

Merged pattern design w/accompanied recipe printed alongside dominant hex code colors of image, score out of 1 to 100 scale for shadows, highlights, temperature (cool or warm) , so a recipe documentation essentially.

01 \u2014 source photo

shadow

#16090A
94.3% of image
score: 94/100

highlight

#B46D52
0.5% of image
score: 0/100

midtone

#682D30
5.2% of image
score: 5/100
