

OUTLINING THE SYSTEM: FOTO RECIPE

– all assets can be found in FILM folder on desktop

- main question that this development is probing - is can an intelligence system recreate/redesign an image as a pattern in an intelligent, creative way that also gives insightful information about the qualities of the image identified (qualities identified below)

It is a user-friendly histogram, transforming your art into art.

The Basic Logic: An intelligence system that analyzes an inputted photo through extraction of an inputted photo through extraction of the qualities of the image. These qualities are defined by:

- shadows
- highlights
- exposure
- saturation
- temperature
- extracted colors of the image into hex codes for each to use for pantone generation (so this is useful for creatives) (this is the most dominant part of the art development that the intelligence system relies on since that was molds the pattern together really and the biggest identifier that the photo is related to the pattern produced)

THEN: The intelligence system reads the inputted image as a formal recipe to produce for the user to recognize the qualities of what made their image, their image. Then the formal output becomes a recipe printed as well as a regenerated pattern of the image. As the qualities identified can be read as shapes. So (the recipe quality system below needs to be refined so it builds a proper pattern)

- shadows = squares
 - highlights = circles
 - saturation = scaled by pattern (dull/less dull colors of the pattern)
-

SO these qualities are to be identified all throughout the image versus just the overall percentage identified by the system. For example if there are 40% out of 100% shadows identified in the image, that doesn't mean there should only be one giant square that is scaled by 40%. I don't want this extraction system, instead I want a dynamic flow of shapes, multiple squares of that area of the image that fits the color scale of the image

that then can be identified 'oh that's where the shadows of the image are'. so the intelligence system operates more fluidly from there. I'm also uploading manual extraction concepts of what i mean from an image to a pattern so you understand how to authentically create the pattern. this will be used as reference of a diagram.

SYSTEM FLOW:

1. FOTO RECIPE - opens up to white screen that types out 'foto recipe' (the uploaded logo/font) i created really big across the screen
 1. I want the clicker to be a old vintage cursor that makes mouse click sounds when user clicks entrance button
 2. it then says -- create your recipe + enter -- then leads to loading screen that leads to the next screen
 3. foto recipe displayed at the top -- what the system is about + what's going to be generated (black background to get the fujifilm vibe/studio lab vibe) -- so description of the qualities of the image + what they translate to as in the shapes etc -- i want to see the shapes visually
 4. this screen also includes the box that says upload image
2. now photo is being analyzed, generated, all qualities considered so now the entire screen loads and slowly shows the qualities showing up like oh shadows is 40% out of 100% , temperature identified is cooler toned image, slightly darkened image, etc so it gives the user digestible description as the recipe is being generated what the intelligence system is identifying before fully printing the recipe
3. then the next screen says, your recipe is ready, open the oven! and it displays their entire full recipe on the browser at the top, shows the original image to pattern development
 1. below it there's an option that says view recipe receipt -- when clicked shows a vintage receipt of their pattern + 'recipe receipt' below it so it can be saved as an image to share with friends, to keep etc. alongside that option there's another option that says ' save to the recipe book' which gives the user an option to save their generated pattern + recipe to the main page of FOTO RECIPE so its essentially a recipe book that gets built by users

ALSO FOR THE PATTERN PRODUCED - THE USER SHOULD BE ABLE TO IDENTIFY FROM THE PATTERN what is what/why their pattern looks like that essentially - so its easily identifiable under like - shadows - shape - with selected color etc

The last alternative generation is another button that says it sees histogram gradient chart - so it shows the curve of the qualities but as a chart (think of photo gradient tone curves for this

diagram) and it brings all the qualities together on display as a chart that users can compare. so the colors of each chart depend on the colors of their image to make the gradient so every user will have a unique chart to themselves

NEXT WEB DEVELOPMENT

– when user opens the homepage ; theres a section that says ‘ the collection ‘ in all caps and opens to a page that shows static folders as reference image below but still with my design system and has user names under the folder ; this is where ppls recipes + patterns will be saved when a folder is clicked on ; reference the design below where its really old computer like , all folders r just outlined blue, not filled in blue, no drop shadow , i like the header shown below too and then theres an option for ‘home’ that goes back to main page
