

Flip 7

A system of terrifying emotions, and gambling without money.

The Artifacts

The Game's Rules

The Flip 7 rulebook sets the few core rules in the system. It however does not mention any strategies or emergent behaviors due to these rules, on purpose.

The system is **simple**, **draw a card or pass for the rest of the round**. If you pull the same number twice, you're **out for the round and get no points**. If you pass or get to 7 cards, **you get to keep the points** (number on the cards added up).

The Artifacts

Number of cards

While not a rule, the system mentions that there are **twelve 12s, eleven 11s, ten 10s, ...** down to one 1, and one 0. While this seems unimportant, it **affects how players view** getting a high number card (**more value but more risk for pulling a duplicate**)

Special cards

Some cards are special, because they **change the behavior of the player** by changing the stakes. Freeze will freeze any player, which could **prevent them from getting more points**. Second Chance **removes the risk** from continuing to pull cards. Changing behaviors adds unique strategies that **can rapidly effect emotions**.

The Artifacts

Video of emotions felt when the stakes change...

When watching examples of this system in action, you can see how the **system affects the players**. You can also see how the bypassing of the standard rules **changed the player’s perspective** of their previous decisions in real-time.

The original video clip can be found here:

Flip 7 Score:

Nancy: 162

Sami: 218

PJ: 36

My Experience

When participating in the system with my friends, I noticed how **different players** employed **different strategies** with the **same set of rules**. These set of strategies **impacted** not only how the **other player’s succeeded**, but also **how they felt**. The rush and fear while playing was an **emergent behavior** that came from **simple rules**.

The Flip 7 System

Input

- Hit: You instruct the dealer to draw one more card from the deck.
- Pass: You signal to the dealer you pass to safely bank your points for the round.

Process/Rule

- The player passed and is not active for this round anymore
- If the player flips a card that matches any of their existing cards, player busts.
- If the player flips a special card, follow instructions on that card.
- If the player flips 7 cards, the round ends and player gets bonus 15 points. Follow next line rules.
- If no player is active (all passed or busted), add up points that remain for each player. Add to their bank. If any reaches 200, they win.

Output

- Deck has less cards and new chances for each card.
- Player has gained points and is active
- The player has passed, kept existing points and not active
- The player has busted and gained no points

OBSERVATIONS

- 1. The risk potential was designed into the system on purpose. It was built into the system's distribution (twelve 12s vs. one 1). This evokes strong feelings when pulling high risk, high reward cards.
- 2. The system naturally escalates risk more as you play. The more successful a player is in a round (collecting multiple unique cards), the higher the chance the system will output a failure (a duplicate) on the next turn.
- 3. The deck "remembers" past actions because drawing a card removes it from the system. If three 3s are on the table, the system "knows" it can never output another 3, altering all future probabilities. This changes the system and behaviors linked to it.
- 4. Action cards like "Freeze" or "Flip Three" act as risk adjusters that temporarily override the core rules to add change and fear.
- 5. The deck evokes emergent behavior through different playstyles, behaviors, and emotions due to the human processing of the psychological risk tolerance.

“Intelligence is when a system evokes fear and stress.”

If a stack of printed cardboard can make a grown adult sweat and second-guess their choices, it has effectively simulated the presence of an intelligent opponent.
